### 3 说明

**TL431LI/TL432LI** 是 **TL431/TL432** 的引脚对引脚替代品。**TL43xLI** 提供更好的稳定性、更低温度漂移 ( $V_{I(dev)}$ ) 以及更低基准电流 ( $I_{ref}$ ), 从而提高了系统精度。

TL431 和 TL432 器件是三端可调节并联稳压器, 在适用的汽车级、商用级和军用级温度范围内均可满足规定的热稳定性。可以通过两个外部电阻器将输出电压设置为介于  $V_{ref}$  (约为 2.5V) 和 36V 之间的任意值。这些器件具有 0.2Ω 的输出阻抗典型值。有源输出电路可提供非常急剧的导通特性, 从而使这些器件在许多应用中成为齐纳二极管的出色替代品, 这些应用包括板载稳压、可调节电源和开关电源。TL432 器件具有与 TL431 器件完全相同的功能和电气特性, 但是具有不同的 DBV、DBZ 和 PK 封装引脚排列。

TL431 和 TL432 器件都具有 B、A 和标准三个等级, 25°C 下的初始容差分别为 0.5%、1% 和 2%。此外, 低输出温漂可确保在整个温度范围内保持出色的稳定性。

TL43xxC 器件运行温度范围为 0°C 至 70°C, TL43xxI 器件运行温度范围为 -40°C 至 85°C, TL43xxQ 器件运行温度范围为 -40°C 至 125°C。

Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltage values are with respect to ANODE, unless otherwise noted.

|          |                                | TL43xxQ   | –40 | 125  |

- (1) Maximum power dissipation is a function of  $T_{J(max)}$ ,  $\theta_{JA}$ , and  $T_A$ . The maximum allowable power dissipation at any allowable ambient temperature is  $P_D = (T_{J(max)} - T_A)/\theta_{JA}$ . Operating at the absolute maximum  $T_J$  of 150°C can affect reliability.

- (1) The deviation parameters  $V_{\text{ref}(\text{dev})}$  and  $I_{\text{ref}(\text{dev})}$  are defined as the differences between the maximum and minimum values obtained over the rated temperature range. The average full-range temperature coefficient of the reference input voltage  $\alpha_{V_{\text{ref}}}$  is defined as:

$$\left| \alpha_{V_{\text{ref}}} \right| \left( \frac{\text{ppm}}{^\circ\text{C}} \right) = \frac{\left( \frac{V_{I(\text{dev})}}{V_{\text{ref at } 25^\circ\text{C}}} \right) \times 10^6}{\Delta T_A}$$

where:

 $\Delta T_A$  is the rated operating temperature range of the device.

 $\alpha_{V_{\text{ref}}}$  is positive or negative, depending on whether minimum  $V_{\text{ref}}$  or maximum  $V_{\text{ref}}$ , respectively, occurs at the lower temperature.

- (2) The dynamic impedance is defined as:  $|z_{KA}| = \frac{\Delta V_{KA}}{\Delta I_{KA}}$

When the device is operating with two external resistors (see Figure 21), the total dynamic impedance of the circuit is given by:  $|z'| = \frac{\Delta V}{\Delta I}$  which is approximately equal to  $|z_{KA}| \left( 1 + \frac{R1}{R2} \right)$ .

- (1) The deviation parameters  $V_{\text{ref(dev)}}$  and  $I_{\text{ref(dev)}}$  are defined as the differences between the maximum and minimum values obtained over the rated temperature range. The average full-range temperature coefficient of the reference input voltage  $\alpha_{V_{\text{ref}}}$  is defined as:

$$\left| \alpha_{V_{\text{ref}}} \right| \left( \frac{\text{ppm}}{^\circ\text{C}} \right) = \frac{\left( \frac{V_{\text{I(dev)}}}{V_{\text{ref at } 25^\circ\text{C}}} \right) \times 10^6}{\Delta T_A}$$

where:

$\Delta T_A$  is the rated operating temperature range of the device.

$\alpha_{V_{\text{ref}}}$  is positive or negative, depending on whether minimum  $V_{\text{ref}}$  or maximum  $V_{\text{ref}}$ , respectively, occurs at the lower temperature.

- (2) The dynamic impedance is defined as:  $|z_{\text{KA}}| = \frac{\Delta V_{\text{KA}}}{\Delta I_{\text{KA}}}$

When the device is operating with two external resistors (see Figure 21), the total dynamic impedance of the circuit is given by:  $|z'| = \frac{\Delta V}{\Delta I}$  which is approximately equal to  $|z_{\text{KA}}| \left( 1 + \frac{R_1}{R_2} \right)$ .

## 9 Detailed Description

### 9.1 Overview

This standard device has proven ubiquity and versatility across a wide range of applications, ranging from power to signal path. This is due to its key components containing an accurate voltage reference & opamp, which are very fundamental analog building blocks. TL43xx is used in conjunction with its key components to behave as a single voltage reference, error amplifier, voltage clamp or comparator with integrated reference.

TL43xx can be operated and adjusted to cathode voltages from 2.5V to 36V, making this part optimum for a wide range of end equipments in industrial, auto, telecom & computing. In order for this device to behave as a shunt regulator or error amplifier,  $>1\text{mA}$  ( $I_{\min}(\text{max})$ ) must be supplied in to the cathode pin. Under this condition, feedback can be applied from the Cathode and Ref pins to create a replica of the internal reference voltage.

Various reference voltage options can be purchased with initial tolerances (at 25°C) of 0.5%, 1%, and 2%. These reference options are denoted by B (0.5%), A (1.0%) and blank (2.0%) after the TL431 or TL432. TL431 & TL432 are both functionally, but have separate pinout options.

The TL43xxC devices are characterized for operation from 0°C to 70°C, the TL43xxI devices are characterized for operation from -40°C to 85°C, and the TL43xxQ devices are characterized for operation from -40°C to 125°C.

### 9.3 Feature Description

TL43xx consists of an internal reference and amplifier that outputs a sink current base on the difference between the reference pin and the virtual internal pin. The sink current is produced by the internal Darlington pair, shown in the above schematic (Figure 24). A Darlington pair is used in order for this device to be able to sink a maximum current of 100 mA.

When operated with enough voltage headroom ( $\geq 2.5$  V) and cathode current ( $I_{KA}$ ), TL431 forces the reference pin to 2.5 V. However, the reference pin can not be left floating, as it needs  $I_{REF} \geq 4$   $\mu$ A (please see [Electrical Characteristics, TL431C, TL432C](#)). This is because the reference pin is driven into an npn, which needs base current in order operate properly.

When feedback is applied from the Cathode and Reference pins, TL43xx behaves as a Zener diode, regulating to a constant voltage dependent on current being supplied into the cathode. This is due to the internal amplifier and reference entering the proper operating regions. The same amount of current needed in the above feedback situation must be applied to this device in open loop, servo or error amplifying implementations in order for it to be in the proper linear region giving TL43xx enough gain.

Unlike many linear regulators, TL43xx is internally compensated to be stable without an output capacitor between the cathode and anode. However, if it is desired to use an output capacitor [Figure 24](#) can be used as a guide to assist in choosing the correct capacitor to maintain stability.

### 9.4 Device Functional Modes

#### 9.4.1 Open Loop (Comparator)

When the cathode/output voltage or current of TL43xx is not being fed back to the reference/input pin in any form, this device is operating in open loop. With proper cathode current ( $I_{KA}$ ) applied to this device, TL43xx will have the characteristics shown in [Figure 23](#). With such high gain in this configuration, TL43xx is typically used as a comparator. With the reference integrated makes TL43xx the preferred choice when users are trying to monitor a certain level of a single signal.

#### 9.4.2 Closed Loop

When the cathode/output voltage or current of TL43xx is being fed back to the reference/input pin in any form, this device is operating in closed loop. The majority of applications involving TL43xx use it in this manner to regulate a fixed voltage or current. The feedback enables this device to behave as an error amplifier, computing a portion of the output voltage and adjusting it to maintain the desired regulation. This is done by relating the output voltage back to the reference pin in a manner to make it equal to the internal reference voltage, which can be accomplished via resistive or direct feedback.

### 10.2.1.2 Detailed Design Procedure

When using TL431 as a comparator with reference, determine the following:

- Input Voltage Range
- Reference Voltage Accuracy
- Output logic input high and low level thresholds
- Current Source resistance

#### 10.2.1.2.1 Basic Operation

In the configuration shown in [Figure 25](#) TL431 will behave as a comparator, comparing the  $V_{REF}$  pin voltage to the internal virtual reference voltage. When provided a proper cathode current ( $I_K$ ), TL43xx will have enough open loop gain to provide a quick response. This can be seen in [Figure 26](#), where the  $R_{SUP}=10\text{ k}\Omega$  ( $I_{KA}=500\text{ }\mu\text{A}$ ) situation responds much slower than  $R_{SUP}=1\text{ k}\Omega$  ( $I_{KA}=5\text{ mA}$ ). With the TL43xx's max Operating Current ( $I_{MIN}$ ) being 1 mA, operation below that could result in low gain, leading to a slow response.

##### 10.2.1.2.1.1 Overdrive

Slow or inaccurate responses can also occur when the reference pin is not provided enough overdrive voltage. This is the amount of voltage that is higher than the internal virtual reference. The internal virtual reference voltage will be within the range of  $2.5\text{ V} \pm(0.5\%, 1.0\% \text{ or } 1.5\%)$  depending on which version is being used. The more overdrive voltage provided, the faster the TL431 will respond.

For applications where TL431 is being used as a comparator, it is best to set the trip point to greater than the positive expected error (i.e. +1.0% for the A version). For fast response, setting the trip point to >10% of the internal  $V_{REF}$  should suffice.

For minimal voltage drop or difference from  $V_{in}$  to the ref pin, it is recommended to use an input resistor <10k $\Omega$  to provide  $I_{ref}$ .

### 10.2.1.2.2 Output Voltage and Logic Input Level

In order for TL431 to properly be used as a comparator, the logic output must be readable by the receiving logic device. This is accomplished by knowing the input high and low level threshold voltage levels, typically denoted by  $V_{IH}$  &  $V_{IL}$ .

As seen in Figure 26, TL431's output low level voltage in open-loop/comparator mode is ~2 V, which is typically sufficient for 5V supplied logic. However, would not work for 3.3 V & 1.8 V supplied logic. In order to accomodate this a resistive divider can be tied to the output to attenuate the output voltage to a voltage legible to the receiving low voltage logic device.

TL431's output high voltage is equal to  $V_{SUP}$  due to TL431 being open-collector. If  $V_{SUP}$  is much higher than the receiving logic's maximum input voltage tolerance, the output must be attenuated to accomodate the outgoing logic's reliability.

When using a resistive divider on the output, be sure to make the sum of the resistive divider ( $R_1$  &  $R_2$  in Figure 25) is much greater than  $R_{SUP}$  in order to not interfere with TL431's ability to pull close to  $V_{SUP}$  when turning off.

### 10.2.1.2.2.1 Input Resistance

TL431 requires an input resistance in this application in order to source the reference current ( $I_{REF}$ ) needed from this device to be in the proper operating regions while turing on. The actual voltage seen at the ref pin will be  $V_{REF} = V_{IN} - I_{REF} * R_{IN}$ . Since  $I_{REF}$  can be as high as 4  $\mu A$  it is recommended to use a resistance small enough that will mitigate the error that  $I_{REF}$  creates from  $V_{IN}$ .

### 10.2.2.2 Detailed Design Procedure

When using TL431 as a Shunt Regulator, determine the following:

- Input Voltage Range
- Temperature Range
- Total Accuracy
- Cathode Current
- Reference Initial Accuracy
- Output Capacitance

#### 10.2.2.2.1 Programming Output/Cathode Voltage

In order to program the cathode voltage to a regulated voltage a resistive bridge must be shunted between the cathode and anode pins with the mid point tied to the reference pin. This can be seen in [Figure 27](#), with R1 & R2 being the resistive bridge. The cathode/output voltage in the shunt regulator configuration can be approximated by the equation shown in [Figure 27](#). The cathode voltage can be more accurately determined by taking in to account the cathode current:

$$V_O = (1 + R1/R2) * V_{REF} - I_{REF} * R1$$

In order for this equation to be valid, TL43xx must be fully biased so that it has enough open loop gain to mitigate any gain error. This can be done by meeting the I<sub>min</sub> spec denoted in [Electrical Characteristics, TL431C, TL432C](#).

### 10.2.2.2.2 Total Accuracy

When programming the output above unity gain ( $V_{KA}=V_{REF}$ ), TL43xx is susceptible to other errors that may effect the overall accuracy beyond  $V_{REF}$ . These errors include:

- R1 and R2 accuracies
- $V_{I(dev)}$  - Change in reference voltage over temperature
- $\Delta V_{REF} / \Delta V_{KA}$  - Change in reference voltage to the change in cathode voltage
- $|z_{KA}|$  - Dynamic impedance, causing a change in cathode voltage with cathode current

Worst case cathode voltage can be determined taking all of the variables in to account. Application note [Setting the Shunt Voltage on an Adjustable Shunt Regulator](#) (SLVA445) assists designers in setting the shunt voltage to achieve optimum accuracy for this device.

### 10.2.2.2.3 Stability

Though TL43xx is stable with no capacitive load, the device that receives the shunt regulator's output voltage could present a capacitive load that is within the TL43xx region of stability, shown in [Figure 16](#) and [Figure 18](#). Also, designers may use capacitive loads to improve the transient response or for power supply decoupling. When using additional capacitance between Cathode and Anode, refer to [Figure 16](#) and [Figure 18](#). Also, application note [Understanding Stability Boundary Conditions Charts in TL431, TL432 Data Sheet](#) (SLVA482) will provide a deeper understanding of this devices stability characteristics and aid the user in making the right choices when choosing a load capacitor.

### 10.2.2.2.4 Start-Up Time

As shown in [Figure 28](#), TL43xx has a fast response up to ~2 V and then slowly charges to it's programmed value. This is due to the compensation capacitance (shown in [Figure 24](#)) the TL43xx has to meet it's stability criteria. Despite the secondary delay, TL43xx still has a fast response suitable for many clamp applications.

## 11 Power Supply Recommendations

When using TL43xx as a Linear Regulator to supply a load, designers will typically use a bypass capacitor on the output/cathode pin. When doing this, be sure that the capacitance is within the stability criteria shown in [Figure 16](#) and [Figure 18](#).

In order to not exceed the maximum cathode current, be sure that the supply voltage is current limited. Also, be sure to limit the current being driven into the Ref pin, as not to exceed it's absolute maximum rating.

For applications shunting high currents, pay attention to the cathode and anode trace lengths, adjusting the width of the traces to have the proper current density.

## 12 Layout

### 12.1 Layout Guidelines

Bypass capacitors should be placed as close to the part as possible. Current-carrying traces need to have widths appropriate for the amount of current they are carrying; in the case of the TL43xx, these currents will be low.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of  $\leq 1000$ ppm threshold. Antimony trioxide based flame retardants must also meet the  $\leq 1000$ ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
